

Ammonium Sulphate (20.5-0-0-23): AS

Benefits:

- Dual Nutrient Supply (Nitrogen + Sulphur): It contains one each of primary and secondary plant nutrients i.e. nitrogen and Sulphur, that determine the plant growth, productivity and quality of final produce.
- The N with S in this fertilizer are ideal constituents to meet nutritional requirements of all crops, as both are important nutrients in the initial stages of plant growth.
- Contains slow releasing nitrogen in ammoniacal form along with Sulphur, which results into a much higher plant response than applying nitrogen alone due to the synergistic interaction between these nutrients.
